Customer Journey Map

Date	29 September 2026
Team ID	SWTID-2026-9550
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	2 Marks

Customer Journey Map

Map out the ServiceNow user's experience stage-by-stage, capturing their actions, touchpoints, thoughts, and feelings, along with process ownership and improvement opportunities at each stage of the Script-Controlled ACL project.

Phase of Journey	**Stage 1** **User & Table Setup**	**Stage 2** **ACL Configuration**	**Stage 3** **Testing & Verification**
Actions *What does the customer do?*	• Create test user • Create roles bb1–bb4 • Create Institution Details table	• Create Read ACL • Configure Create/Write/Delete ACLs • Add roles and conditions/scripts	• Impersonate users • Open Student Records list • Check allowed operations
Touchpoint *What part of the service do they interact with?*	• User Administration • Roles • System Definition → Tables	• System Security → Access Control • ACL records • Script and Data Condition fields	• Impersonate User • Institution Details list • Record forms and list actions
Customer Thought *What is the customer thinking?*	• Are the user and roles configured correctly? • Is the table structure correct? • Which fields need protection?	• Will the ACL restrict unauthorized users? • Are roles mapped to the correct operations? • Does the Branch condition work?	• Can bb1 users view EEE records? • Can each role perform its operation? • Can admin access all records?
Customer Feeling *What is the customer feeling?*	• Focused • Curious • Ready to configure security	• Careful • Security-conscious • Confident when ACLs save correctly	• Assured • Satisfied • Confident after successful verification

Process Ownership *Who is in the lead on this?*	**ServiceNow Administrator** Configures users, roles, table and ACL rules.	**ACL / Security Configurator** Implements role and field-based access control.	**Administrator / Tester** Impersonates users and verifies access.
Opportunities *How can we improve this stage?*	• Use clear role names • Define required fields • Document table structure	• Keep ACL conditions clear • Validate role requirements • Test scripts before deployment	• Test every operation • Verify unauthorized access is blocked • Document expected results
