Project Title	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	5 Marks

Project Proposal (Proposed Solution) report

The project uses a Script-Controlled Access Control List (ACL) in ServiceNow to restrict record access based on a specified field value. The ACL script checks the field value and controls whether a user is allowed to access the record, providing controlled and secure access to ServiceNow records.

Project Overview	
Objective	To provide controlled and secure access to ServiceNow records by evaluating user roles together with record field values through Script-Controlled ACLs.
Scope	Create users and custom roles, build the **u_institution_details** table, and implement READ, CREATE, WRITE, and DELETE ACLs for institution/student records.
Problem Statement	
Description	Without appropriate record-level controls, users may access records beyond their permitted branch or perform actions that should be restricted by role.
Impact	Incorrect access can expose sensitive student/institution information and allow unauthorized viewing, creation, modification, or deletion of records.
Proposed Solution	
Approach	Use ServiceNow ACL rules and a server-side script to evaluate roles and the record's Branch value. Administrators receive full access, while permitted users are controlled through custom roles and ACL operations.
Key Features	- Script-controlled READ access based on the Branch field. - Role-based CREATE, WRITE, and DELETE controls. - Admin users can access all records. - Access is verified through user impersonation and record lists.

Resource Requirements

Resource Type	Description	Specification/Allocation
Hardware		
Computing Resources	Computer required to configure and test the ServiceNow project	Standard development PC/laptop
Memory	RAM for browser, ServiceNow instance access and documentation	8 GB recommended
Storage	Local space for project documents and exported configuration files	At least 20 GB free
Software		
Platform	Cloud platform used to configure tables, users, roles and ACLs	ServiceNow instance
Scripting	Server-side scripting for ACL access decisions	ServiceNow JavaScript ACL script
Browser	Access to ServiceNow administration and testing interfaces	Modern web browser
Admin Tools	Configuration and security administration features	Application Navigator, System Security, Security Admin
Data		
Institution Details	Custom table containing student/institution records	u_institution_details
Fields	Record fields used by the project	Roll Number, Student Name, Faculty Name, Branch, Email, Phone Number, Description
Roles	Custom roles used to control ACL operations	bb1, bb2, bb3, bb4

Expected Outcome: The completed project demonstrates record-level security using script-controlled READ, WRITE, CREATE and DELETE ACLs, with access decisions based on user roles and record field values.
