Performance Testing

Date	15 March 2026
Team ID	SWTID-2026-9550
Project Name	Script-Controlled ACL – Restrict Record Access Based on Field Value
Maximum Marks	5 Marks

Performance Testing

Performance testing evaluates how the system behaves under expected and peak load conditions. For this project, the supplied documentation focuses on ACL access-control verification and does not provide measured load-testing results. Therefore, unmeasured performance values are explicitly marked rather than being invented.

Step 1: Testing Overview

Field	Details
Testing Tool Used	Not specified in the project document
Type of Testing	ACL functional / access-control verification; performance measurements not documented
Target Module / API	ServiceNow table: u_institution_details (Institution Details)
Test Environment	ServiceNow instance; exact environment not specified in the project document
Test Date	15 March 2026

Step 2: Test Scenarios

S.No	Test Scenario / Description	No. of Virtual Users	Duration (sec)	Expected Outcome
1	READ ACL – EEE user with bb1 accesses Institution Details EEE records	Not measured	Not measured	EEE records are accessible to the authorized user; admin has full access.
2	READ ACL – user without required role attempts to access records	Not measured	Not measured	Unauthorized user cannot view the protected records.
3	CREATE / WRITE ACL – users with bb2 and bb3 perform permitted operations	Not measured	Not measured	Authorized users can create and edit records according to assigned roles.
4	DELETE ACL – user with bb4 performs permitted deletion	Not measured	Not measured	Authorized user can delete records; unauthorized users are restricted.

Step 3: Performance Test Results

S.No	Metric	Target Value	Actual Value	Status (Pass / Fail)	Remarks
1	Response Time (Avg)	< 2 seconds	Not measured	N/A	No performance measurement supplied.
2	Response Time (Max)	< 5 seconds	Not measured	N/A	No performance measurement supplied.
3	Throughput (Req/sec)	Not specified	Not measured	N/A	Load/throughput results are not documented.
4	Error Rate	< 1%	Not measured	N/A	No measured error-rate result supplied.
5	CPU Utilization	< 80%	Not measured	N/A	Server utilization data is not documented.
6	Memory Utilization	< 80%	Not measured	N/A	Memory utilization data is not documented.

Step 4: Observations & Analysis

Key Findings: The project documentation demonstrates record-level security through script-controlled READ, CREATE, WRITE and DELETE ACLs. The documented verification checks role-based access and admin access. No measured performance results are included.
Bottlenecks Identified: No performance bottlenecks are documented in the supplied project material. A load-testing tool, concurrency level and timing results are not specified.
Optimization Steps Taken: No performance optimization steps are documented. The documented implementation focuses on role and field-value based access control.

Step 5: Screenshots / Evidence

Attach screenshots of the ServiceNow ACL configuration, user-role setup, and verification results below. The supplied project document contains configuration and verification steps but does not contain performance-tool screenshots.

[Insert Screenshot 1 here – READ ACL / Branch condition]

[Insert Screenshot 2 here – CREATE / WRITE / DELETE ACL verification]

Note: Actual performance values should be entered after running a load/performance test. The values above are intentionally not fabricated because the supplied project document does not provide them.
